

State of Washington
TRUST WATER RIGHT
REPORT OF EXAMINATION

File NR: CS4-07252J(B)
 WR DOC ID: 4700946

Change Purpose of Use		Change Place of Use
PRIORITY DATE 1889	TRUST TERM Permanent	WATER RIGHT NUMBER Beaver Creek Adjudicated Certificate 252
APPLICANT: Susan Marracci 451 Bally Hill Road Twisp, WA 98856-9762		FILE NUMBER CS4-07252J(B)

REMARKS: This change reflects Ecology’s purchase of late season water rights from Susan Marracci.

Purpose and Quantity

Instream flows in the following quantities are attributed to the Primary and Secondary Reaches of Beaver Creek.

PURCHASE (7 acres)					
		Primary Reach		Secondary Reach	
		Qa (ac-ft)	Qi (cfs)	Qa (ac-ft)	Qi (cfs)
August 1-31	8.6	0.14	3.4	0.06	
September 1-15	4.1	0.14	2.2	0.06	
Total	12.7		5.6		

Place of Use (See Map in Attachment 1)

Primary Reach – Approximately 0.9 miles of Beaver Creek beginning at the point of diversion within the NW¼SE¼ of Section 35, T. 34 N., R. 22 E.W.M. at river-mile 6.7, extending downstream to river-mile 5.8.

Secondary Reach – Approximately 5.8 miles of Beaver Creek Beginning at the end of the primary reach at river-mile 5.8, and extending downstream to the confluence of Beaver Creek and the Methow River.

**PORTION OF WATER RIGHT
NOT BEING TRANSFERRED TO INSTREAM FLOWS
WRTS File #: S4-07252J(A)**

PRIORITY DATE	WATER RIGHT NUMBER
1889	Beaver Creek Adjudicated Certificate 252

Purpose and Quantity

Irrigation of 60.55 acres; 53.55 acres may be irrigated from May 1 thru September 15 and 7 acres from May 1 thru July 31.

1.211 cfs, 318.2 ac-ft/yr

Source Location

COUNTY	WATERBODY	TRIBUTARY TO	WATER RESOURCE INVENTORY AREA
Okanogan	Beaver Creek	Methow River	48
POINT OF DIVERSION			
NW¼SE¼ of Section 35, T. 34 N., R. 22 E.W.M.			

Place of Use

Lot 3, Except 2 acres, and the S½NW¼ of Section 2, T. 33 N., R. 22 E.W.M.

Measurement of Water Use

How often must water use be measured?	Monthly
How often must water use data be reported to Ecology?	Annually, by January 31 st of each calendar year.
What volume should be reported?	Total Annual Volume
What rate should be reported?	Monthly Peak Rate of Diversion in cfs.

Provisions Related to the Portion of the Water Right Being Retained

Water Measurement

An approved measuring device must be installed and maintained for each of the sources identified by this water right in accordance with the rule “Requirements for Measuring and Reporting Water Use”, WAC 173-173, which describes the requirements for data accuracy, device installation and operation, and information reporting. It also allows a water user to petition the Department of Ecology for modifications to some of the requirements.

Recorded water use data shall be submitted via the Internet. To set up an Internet reporting account, contact the Regional Office. If you do not have Internet access, you can still submit hard copies by contacting the Regional Office for forms to submit your water use data.

Easement Right of Way

Department of Ecology personnel, upon presentation of proper credentials, shall have access at reasonable times, to the records of water use that are kept to meet the above provisions, and to inspect at reasonable times any measuring device used to meet the above provisions.

Fish Screening Criteria

The intake(s) shall be screened in accordance with Department of Fish and Wildlife screening criteria (pursuant to RCW 77.57.010, RCW 77.57.070, and RCW 77.57.040). If you have questions about screening criteria, contact the Department of Fish and Wildlife at:

Department of Fish and Wildlife
Attention: Habitat Program
600 Capitol Way N
Olympia, WA 98501-1091

Phone: (360) 902-2534
Email: habitatprogram@dfw.wa.gov
Website: <http://wdfw.wa.gov/conservation/habitat/planning/screening/>

No dam or weir shall be constructed in connection with this diversion.

Findings of Facts

Upon reviewing the investigator's report, I find all facts relevant and material to the subject application have been thoroughly investigated. Furthermore, I concur with the investigator that there will be no impairment of existing rights and that there will be no detriment to the public interest.

Therefore, I ORDER approval of Change Application No. CS4-07252J(B), subject to existing rights and the provisions specified above.

YOUR RIGHT TO APPEAL

You have a right to appeal this Order to the Pollution Control Hearings Board (PCHB) within 30 days of the date of receipt of this Order. The appeal process is governed by Chapter 43.21B RCW and Chapter 371-08 WAC. "Date of receipt" is defined in RCW 43.21B.001 (2).

To appeal you must do the following within 30 days of the date of receipt of this Order:

- File your appeal and a copy of this Order with the PCHB (see addresses below). Filing means actual receipt by the PCHB during regular business hours.
- Serve a copy of your appeal and this Order on Ecology in paper form - by mail or in person. (See addresses below.) E-mail is not accepted.

You must also comply with other applicable requirements in chapter 43.21B RCW and chapter 371-08 WAC.

BACKGROUND

On October 14, 2010 Susan Marracci filed 2 applications with the Washington State Department of Ecology (Ecology) to transfer late season irrigation from two Beaver Creek water rights to trust. These applications correspond to the sale of water rights by Susan Marracci to Trout Unlimited (TU), a nonprofit corporation working on behalf of Ecology to increase flows in Beaver Creek during times of critically low flows; the project seeks to eliminate the diversion of water for these rights from August 1 to May 1st of the following irrigation season. TU purchased the late season water from Beaver Creek Adjudicated Certificates 228 and 252.

This report specifically addresses the proposed changes to Beaver Creek Adjudicated Certificate 252. TU permanently acquired (purchased) the late season water associated with 10.2 acres covered by Certificate 252. It is the task of this investigator to recommend whether this water may be transferred to instream flows.

Significant efforts are being made to restore flows in Beaver Creek because it was historically a steelhead stream and could produce up to 10% of the Methow River run if fully functional (Mark Cookson, WDFW), with spawning and rearing as the major biological function. In the 2001 Methow Subbasin Plan, Beaver Creek is listed as a critical tributary and instream flow is identified as a limiting factor. In addition, this project will address several of the strategies identified in the 2004 Methow Subbasin Plan:

- Increase the survival of summer steelhead and bull trout at all juvenile summer and winter rearing life stages.
- Support resident and anadromous fishes similar to an undisturbed watershed of similar size, geology and geography.
- Protect key habitat and channel conditions by restoring and maintaining habitat processes.
- Protect healthy areas and restore degraded riparian zones to a more natural condition.

Increasing flows will lower stream temperatures in summer months, which is especially needed in the lower reaches of the Methow River. Higher flows also dilute toxic materials or other contaminants entrained in the stream.

Table 1: Attributes of Certificate No. 252 and the Proposed Changes

Attributes	Existing	Proposed
Name	Methow Valley Livestock Company	Trust Portion: Department of Ecology Retained Portion: Susan Marracci, and the other existing property owners
Priority Date/ Change Application Date	Priority Date – 1889 (Class 3)	Application Date – October 14, 2010
Instantaneous Quantity	1.21 cfs	Trust Portion: 0.20 cfs in the late season

Table 1 - continued

Attributes	Existing	Proposed
Purpose of Use	Irrigation of 60.55 acres	Trust Water Portion: Instream Flow Retained Portion: Crop Irrigation
Period of Use	May 1 through September 15	Trust Portion: Instream Flow (Aug 1 through Sep 15) Retained Portion: May 1 through July 31
Place of Use	S½NW¼ and NE¼NW¼ of Sec. 2, T. 33 N., R. 22 E.W.M.	Trust Water Portion: Instream flow in Beaver Creek Retained Portion: Same
Point of Diversion	SW¼SE¼ of Section 35, T. 34, N. R. 22, E.W.M.	Trust Water Portion: No diversion Retained Portion: Same

Legal Requirements for Proposed Change

The following is a list of requirements that must be met prior to authorizing any change to a water right.

- **Public Notice**

Notice of the proposed appropriation was published in the Methow Valley News of Twisp, Washington, on November 16th and November 23rd, 2011. The protest period ended on December 24, 2011. One protest letter was received; see the *Protests and Comments* section below.

- **State Environmental Policy Act (SEPA)**

This project required a SEPA review under WAC-197-11-800(4). Ecology, acting as the SEPA lead agency, determined that this project will not have a probable significant adverse impact on the environment and issued a Determination of Non-significance (DNS) on January 17, 2012. No comments were received.

- **Water Resources Statutes and Case Law**

Transferring a water right to the Trust Water Right Program is governed by RCW 90.42.

Washington Supreme Court has held that Ecology, when processing an application for change to a water right, is required to make a tentative determination of extent and validity of the claim or right. This is necessary to establish whether the claim or right is eligible for change.

R.D. Merrill v. PCHB and Okanogan Wilderness League v. Town of Twisp.

This application qualifies for expedited processing under WAC 173-152-050(3)(a) whereby water right change applications may be processed prior to applications submitted at an earlier date when the proposed water use, if approved, would substantially enhance or protect the quality of the natural environment.

INVESTIGATION

History of Water Use

Beaver Creek and its tributaries were adjudicated in Okanogan Superior Court. Final Decree No. 3935 was issued on September 20, 1921. Beaver Creek Adjudicated Certificate No. 252 was issued to the Methow Valley Livestock Company and authorizes the use of 1.21 cfs to irrigate 60.55 acres of irrigation.

The authorized point of diversion is in the NW¼SE¼ of Section 35, T. 34 N., R. 22 E.W.M., which is the start of the Beaver Creek Canal. The place of use for Certificate 252 is S½NW¼ and NE¼NW¼ of Sec. 2, T. 33 N., R. 22 E.W.M. Currently, there are eight land owners whose parcels intersect the place of use for Certificate 252. Susan Marracci owns a 25.08 acre parcel within the place of use (See Figure 1 and 2 below).

Figure 1: Places of use for Certificates 228 and 252

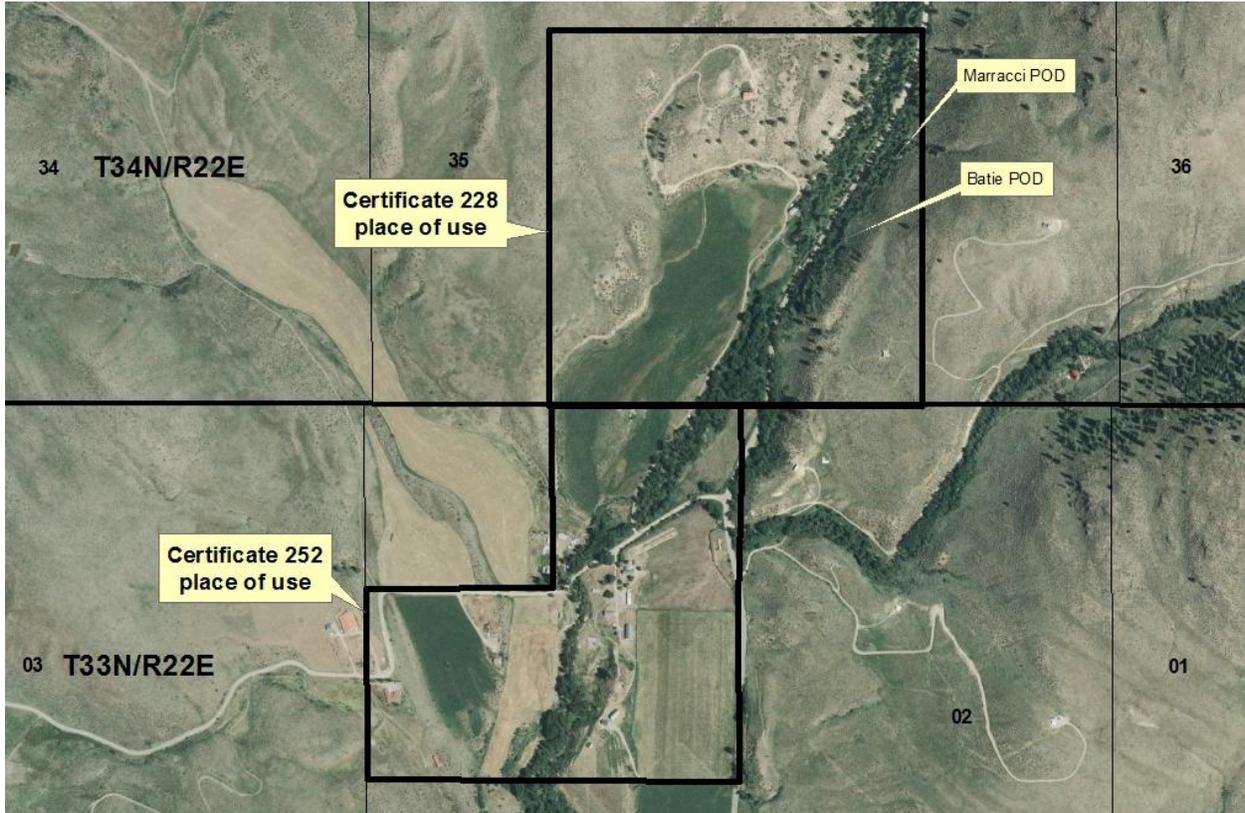

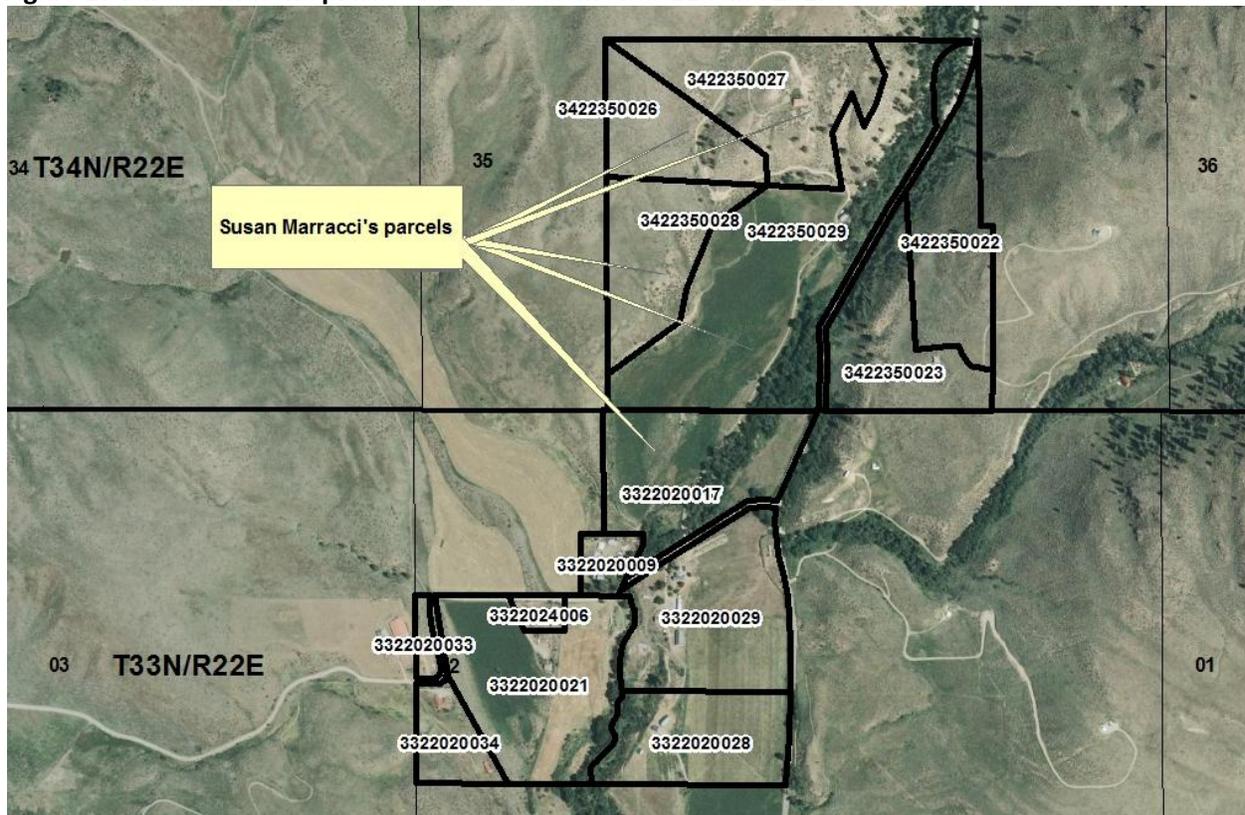

Figure 2: Parcels with the places of use for Certificates 228 and 252.

Site Visit

On April 12, 2012, Steven Hughes of Hart Crowser Consulting (hired on behalf of Ecology) met with Aaron Penvose of TU to observe the original point of diversion from Beaver Creek, irrigated lands, and irrigation methods.

Other Water Rights Appurtenant to Existing Place of Use

Beaver Creek Adjudicated Certificate 223 was issued to Edward Boning for irrigation of 2 acres and continuous stock and domestic use within the NE $\frac{1}{4}$ NW $\frac{1}{4}$ of Section 2, T. 33 N., R. 22 E.W.M. from a point of diversion in the same area.

Tentative Determination of the Extent and Validity

To change a water right, Ecology must make a tentative determination as to the extent and validity of the right. Under RCW 90.14.160, any portion of a water right not exercised for a period of five successive years, without sufficient cause, shall be relinquished and revert to the state.

To assess the extent and validity of Certificate No. 252, past irrigation practices and water use were evaluated. Susan Burgdorff-Beery, Ecology's Watermaster, indicated that records for Beaver Creek were not kept after 2006. Due to limited water use records, aerial photographs of the site provided a better indicator of extent and validity of the right. Aerial photographs from 1964, 1974, 1989, 2000, 2005, 2006, 2009, and 2011 were reviewed to identify the extent of irrigated lands within the authorized place of use. A total of approximately 60.55 acres appear to have been historically irrigated within the authorized place of use under Certificate 252.

The instantaneous diversion rate (Qi) awarded in the Beaver Creek Adjudication is 0.02 cfs per acre. Therefore the maximum diversion rate associated with 60.55 acres is 1.211 cfs. The total volume authorized under Certificate 252 is estimated to be a maximum of 330.60 ac-ft/yr. This calculation is based on 0.02 cfs per acre:

$$0.02 \text{ cfs} \times 1.98 \text{ ac-ft/day per cfs} \times 138 \text{ days of irrigation} = 5.46 \text{ ac-ft/yr per acre}$$

$$5.46 \text{ ac-ft/yr} \times 60.55 \text{ acres} = 330.60 \text{ ac-ft/yr}$$

Annual Consumptive Quantity Test (ACQ)

RCW 90.03.380(1) requires that Ecology perform an annual consumptive quantity test (ACQ) when investigating a water right change proposing additional uses. New uses may be permitted if the change results in no increase in the annual consumptive quantity of water to be used under the water right. The test states that the future consumptive use cannot exceed the average of the two highest years of the last 5 years of continuous use. Based on recent air photos, approximately 60.55 acres have been consistently irrigated. The water duty associated with those acres is considered the average use for this test.

To estimate the consumptive use portion (%CU), Ecology relies on the Washington Irrigation Guide (WIG). The WIG data provides the estimated Crop Irrigation Requirement (CIR), which is the amount of water a crop needs in excess of rainfall. The CIR for alfalfa near the Methow Station is 25 inches (2.08 ft) from May to October. The total irrigation requirement (TIR) is the CIR divided by the application efficiency (Ea%), see calculations below. Consumptive use can be estimated using Ecology's Guidance 1210: Table 1 in which Ea% and evaporation (Evap%) are listed by irrigation method.

The following calculations are based on hand-line sprinklers that are assumed to be 75% efficient (Ea%). The estimated consumptive water use under Certificate 252 is 142.29 ac-ft/yr. If the proposed changes are approved, consumptive use cannot exceed this quantity.

$$\begin{aligned} \text{TIR} &= \text{CIR} \div \text{Ea} \\ \text{TIR} &= 2.08 \text{ ft/acre} \div 0.75 \\ \text{TIR} &= 2.77 \text{ ft/acre} \\ \text{\%CU} &= \text{Ea} + \text{Evap} \\ \text{\%CU} &= 75\% + 10\% = 85\% \\ \text{CU} &= \text{TIR} \times \text{\%CU} \\ \text{CU} &= 2.77 \text{ ft/acre} \times 85\% \\ \text{CU} &= 2.35 \text{ ft/acre} \\ \text{CU} &= 2.35 \text{ ft/acre} \times 60.55 \text{ acres} \\ \text{CU} &= 142.29 \text{ ac-ft/yr} \end{aligned}$$

Water Right Change

As part of the agreement with TU, Ms. Marracci she applied to transfer 10.2 acres of late season irrigation water to instream flows in Beaver Creek. However, during the tentative determination analysis described above, it was noted that 7 acres of irrigation could be identified within Ms. Marracci's

property that is covered by Certificate 252. Therefore the late season water for 7 acres of irrigation is available to be transferred to instream flows.

The following sections describe the primary and secondary stream reaches that benefit from water being transferred to instream flows. Each reach is assigned a volume of water based on late season fallowing of 7 acres.

Primary Reach

The primary reach is the portion of the stream that benefits from return flows and what would otherwise be consumed by growing crops. The primary reach extends from the historic point of diversion to the point where return flows historically rejoined the stream adjacent to the southern-most field. The length of the primary reach in Beaver Creek is approximately 0.85 miles; from river-mile 6.7 to river-mile 5.8 (see Attachment 1).

Late season fallowing will occur for a total of 46 days (August 1 to September 15). The total volume authorized under Certificate 252 is estimated to be a maximum of 12.7 ac-ft/yr, 0.14 cfs. This calculation is based on 0.02 cfs per acre:

$$0.02 \text{ cfs} \times 1.98 \text{ ac-ft/day per cfs} \times 31 \text{ days of irrigation in August} = 1.23 \text{ ac-ft} \times 7 \text{ acres} = 8.6 \text{ ac-ft}$$

$$0.02 \text{ cfs} \times 1.98 \text{ ac-ft/day per cfs} \times 15 \text{ days of irrigation in September} = 0.59 \text{ ac-ft} \times 7 \text{ acres} = 4.1 \text{ ac-ft}$$

Secondary Reach

The secondary reach is the portion of the stream that benefits only from what would otherwise have been consumed by growing crops (consumptive use). The secondary reach extends from the end of the primary reach to the confluence of the next major tributary, the Methow River. The secondary reach in Beaver Creek is approximately 5.8 miles long beginning at the end of the primary reach at river-mile 5.8, and extending downstream to the confluence of Beaver Creek and the Methow River.

Late season fallowing will occur for a total of 46 days (August 1 to September 15). The WIG states that alfalfa near the Methow Station requires 5.0 inches per acre in August and 3.36 inches per acre in September (or 0.42 ft and 0.28 ft respectively). The consumptive use associated with 7 acres of late season irrigation is 5.6 ac-ft/yr, 0.06 cfs based on the following calculations:

August 1-31	September 1-15
TIR = CIR ÷ Ea	TIR = CIR ÷ Ea
TIR = 0.42 ft/acre ÷ 0.75 = 0.56 ft/acre	TIR = 0.28 ft/acre ÷ 0.75 = 0.37 ft/acre
%CU = Ea + Evap	%CU = Ea + Evap
%CU = 75% + 10% = 85%	%CU = 75% + 10% = 85%
CU = TIR x %CU	CU = TIR x %CU
CU = 0.56 ft/acre x 85%	CU = 0.37 ft/acre x 85%
CU = 0.48 ft/acre	CU = 0.32 ft/acre
CU = 0.48 ft/acre x 7 acres	CU = 0.32 ft/acre x 7 acres
CU = 3.4 ac-ft	CU = 2.2 ac-ft
Total = 5.6 ac-ft	

Instantaneous Quantity equals: 5.6 ac-ft/yr ÷ 46 days in the late season ÷ 1.98 ac-ft/day per = 0.06 cfs

Table 2: Summary of the quantities available for transfer by month.

	PURCHASE (7 acres)			
	Primary Reach		Secondary Reach	
	Qa (ac-ft)	Qi (cfs)	Qa (ac-ft)	Qi (cfs)
August 1-31*	8.6	0.14	3.4	0.06
September 1-15*	4.1	0.14	2.2	0.06
Total	12.7		5.6	

Impairment Considerations

Ms. Marracci has agreed to cease diverting water after July 31st of each year and will not begin diverting until May 1st of the following year. Changing the purpose of these late season water rights to instream flows would not result in any increase in consumptive use of water. The proposed action is intended to decrease future consumptive use. After July 31st, water that would otherwise have been used for irrigation under Certificate 252 will remain instream to benefit flows. Increased flows should not impair or injure other water rights on Beaver Creek.

Public Interest Considerations

The acquisition of water for instream flows in Beaver Creek is anticipated to improve habitat and survival of listed species in the Upper Columbia ESU.

Consideration of Protests and Comments

A protest letter was received on December 14, 2011 from Bernard and Dianne Thurlow. Their concerns are outlined and discussed below:

- 1) *There is no way to measure the amount of water diverted from the creek because of the large variation in evaporation losses.*

Response: Only the portion of the water right that has been historically used can be transferred to instream flows. Ecology uses the Washington Irrigation Guide (WIG) to approximate water use based on irrigation practices, soils, and crop irrigation requirements. Extensive work has been done by the NRCS to develop specific station data (Methow Station for Beaver Creek crop irrigation requirements) with average monthly precipitation and irrigation requirements by crop type. The WIG data is coupled with GUID-1210, which provides information to evaluate application efficiency ranges, consumptive use, and return flows for crops. These documents allow Ecology to reasonably estimate water usage, including evaporation losses.

- 2) *By leaving water in Beaver Creek and not using it for irrigation you reduce the volume of irrigation water that would eventually infiltrate and be stored in the stream banks. Doing this*

reduces the volume of water available to discharge from the banks back into the stream during periods of low flow. These actions violate the Referee's Report. The lack of recharge could affect the water availability to the Beaver Creek water users when the creek is normally low, including the fish.

Response: The proposed project is intended to leave water in Beaver Creek during the lowest flow periods. Fluvial recharge occurs primarily when stream flows are high and the water infiltrates to relatively lower ground water through the stream bed and banks. During the base flows periods (late in the summer and fall), groundwater tends to discharge to the stream.

Applying irrigation water heavily in the early and mid-portions of the irrigation season can store water that flows back to Beaver Creek later in the irrigation season. Applying irrigation water late in the season, during Beaver Creek's base flow period, is less effective in supporting Beaver Creek's streamflow than leaving water in Beaver Creek.

Lastly, Ecology lacks the authority to require a water right holder to use its water right to irrigate its lands (PCHB No. 00-189).

3) *Our existing water rights shall not be impaired.*

Response: A water right cannot be changed if the change would impair any other users. Leaving water instream would not harm another water user's ability to access water (see the Impairment Considerations section above).

CONCLUSIONS

It is the conclusion of this examiner that a total of 0.14 cfs, 12.7 ac-ft/yr may be transferred to instream flows under Certificate 252 and that doing so would not impair existing rights in accordance with RCW 90.42.

RECOMMENDATIONS

Based on the information presented above, the author recommends that CS4-07252J(B) be approved in the amounts, and subject to the provisions described in the Order for Report of Examination on pages 1-3 in the following quantities:

	PURCHASE (7 acres)			
	Primary Reach		Secondary Reach	
	Qa (ac-ft)	Qi (cfs)	Qa (ac-ft)	Qi (cfs)
August 1-31	8.6	0.14	3.4	0.06
September 1-15	4.1	0.14	2.2	0.06
Total	12.7		5.6
